The PTS/WK (VORP) column shows you how many more points per week are expected from this player, relative to the best bench player at this position.

Auction draft:

The COST column scales the VORP value based on your league budget.

This means, for example, that if you see QB Mahomes at \$90 and TE Pitts at \$10, they should have the same fantasy value as QB Hurts at \$10 and TE Kelce at \$90.

The concept of this chart is to help you find the best value for your money. You should see the COST column as "never go about this price".

Your goal during the auction is to acquire as many players as you can for prices below this COST value. That means you're getting more points per dollar than the average. You should have a more robust roster, as well as money left for bench players.

Snake draft:

The VALUE column compares the player's VORP to the projected starters at his position. This tells you how important this player is relative to others at his position.

This means, for example, that QB Mahomes at +10 PTS/WK might seem to have the same value as TE Kelce at +10 PTS/WK, but there might be several QBs that are close to +10 PTS/WK, while there are no other TEs close to +10 PTS/WK. Kelce has a higher value overall, because no one else at that position is a good substitute.
